BARRIER: Insufficient Participation of Staff in the Promotion of Vaccination Health

What we know

- Vaccination is not part of routine health care
- There are missed opportunities with medical service visits
- Survey results show that people who were not vaccinated during campaigns, visited their doctor during those days

BARRIER: Insufficient Participation of Staff in the Promotion of Vaccination Health

- Vaccination and the impact of infectious diseases are not addressed as an important issue by health teams
- This poor communication between service users and health teams helps myths and fears about vaccination and content is not clarified
- Undervaluing the role of other professionals, besides medical expertise
- Vaccination and multidisciplines
- Poor inter-professional education
- Lack of new vaccines

BARRIER: Insufficient Participation of Staff in the Promotion of Vaccination Health

- Your Doctor may play a role in discouraging vaccination when they are not convinced of the effectiveness and benefits of vaccinations
 - Poor perception of their own risks and their immediate environment
 - Fear of undesired effects
 - Fear of injections

BARRIER: Insufficient Participation of Staff in the Promotion of Vaccination Health

- Poor skills on the principles of PHC in most specialists: health promotion is alien to everyday practice
- Unawareness of older adults and their environment and needs
- Additional benefits of vaccination
- Unfocused health teams for the population
- The role of Medical Societies and Associations

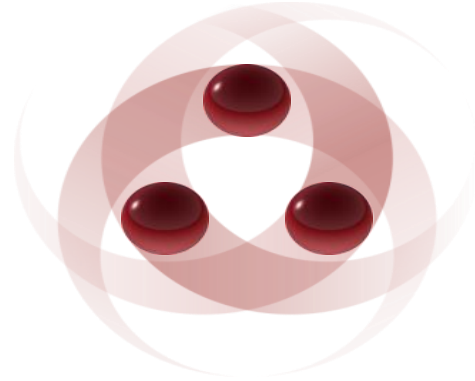

To take into account from the user...

- Confidence in your Doctor
- Confidence in the health system and authorities
- Confidence in manufactures
- Misleading advertising (anti-vaccine groups)

-
- Multiple studies show that the active participation of health professionals increases vaccination coverage
 - Influence on “Acceptance, Alert and Activation”
