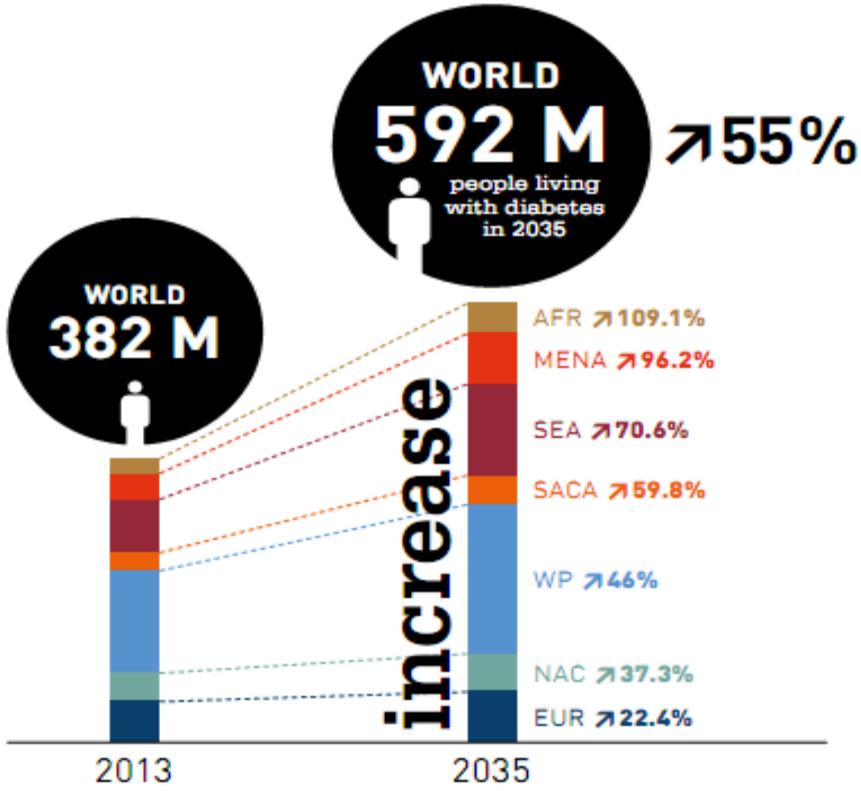
Diabetes is a **huge and growing problem**, and the costs to society are **high and escalating**



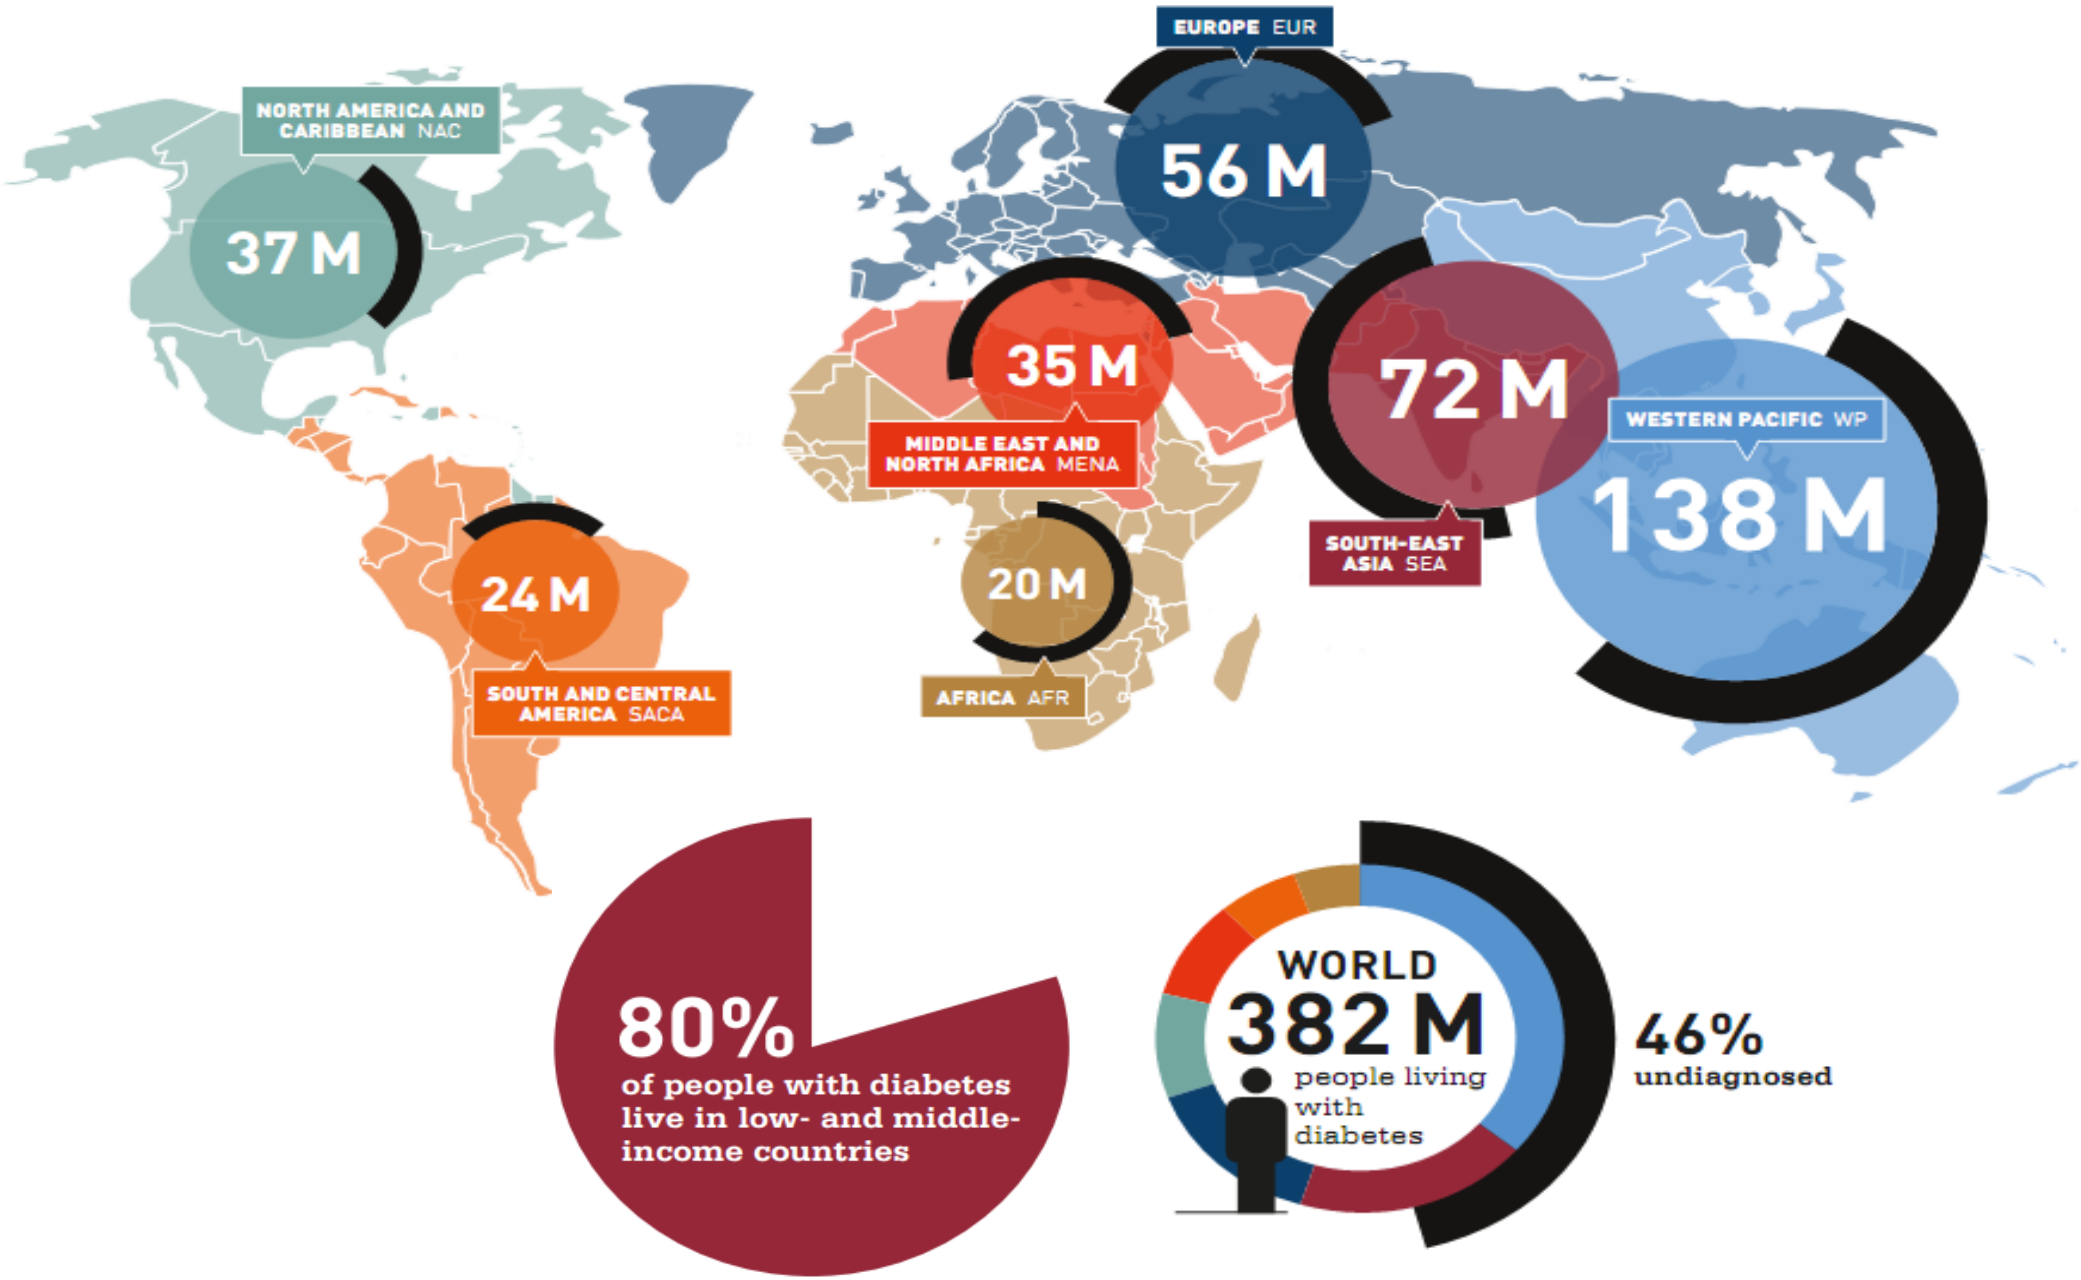
382 million people have diabetes

By **2035**, this number will rise to **592 million**

Urbanisation…..

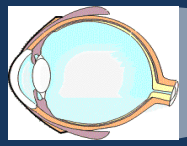
Coca-Cola

Number of people with diabetes by IDF Region, 2013



Diabetic Complications

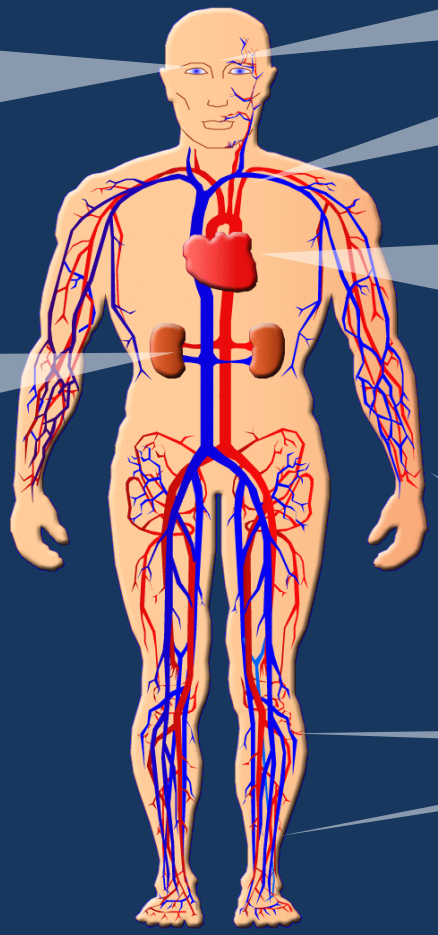
Leading cause of blindness in working age adults



Diabetic Retinopathy

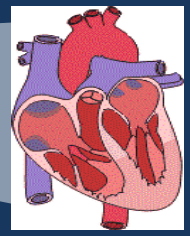
Diabetic Nephropathy

Leading cause of end-stage renal disease

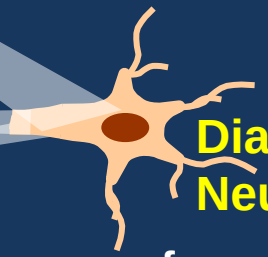


Stroke

2- to 4- fold increase in cardiovascular events and stroke



Cardiovascular Disease



Diabetic Neuropathy

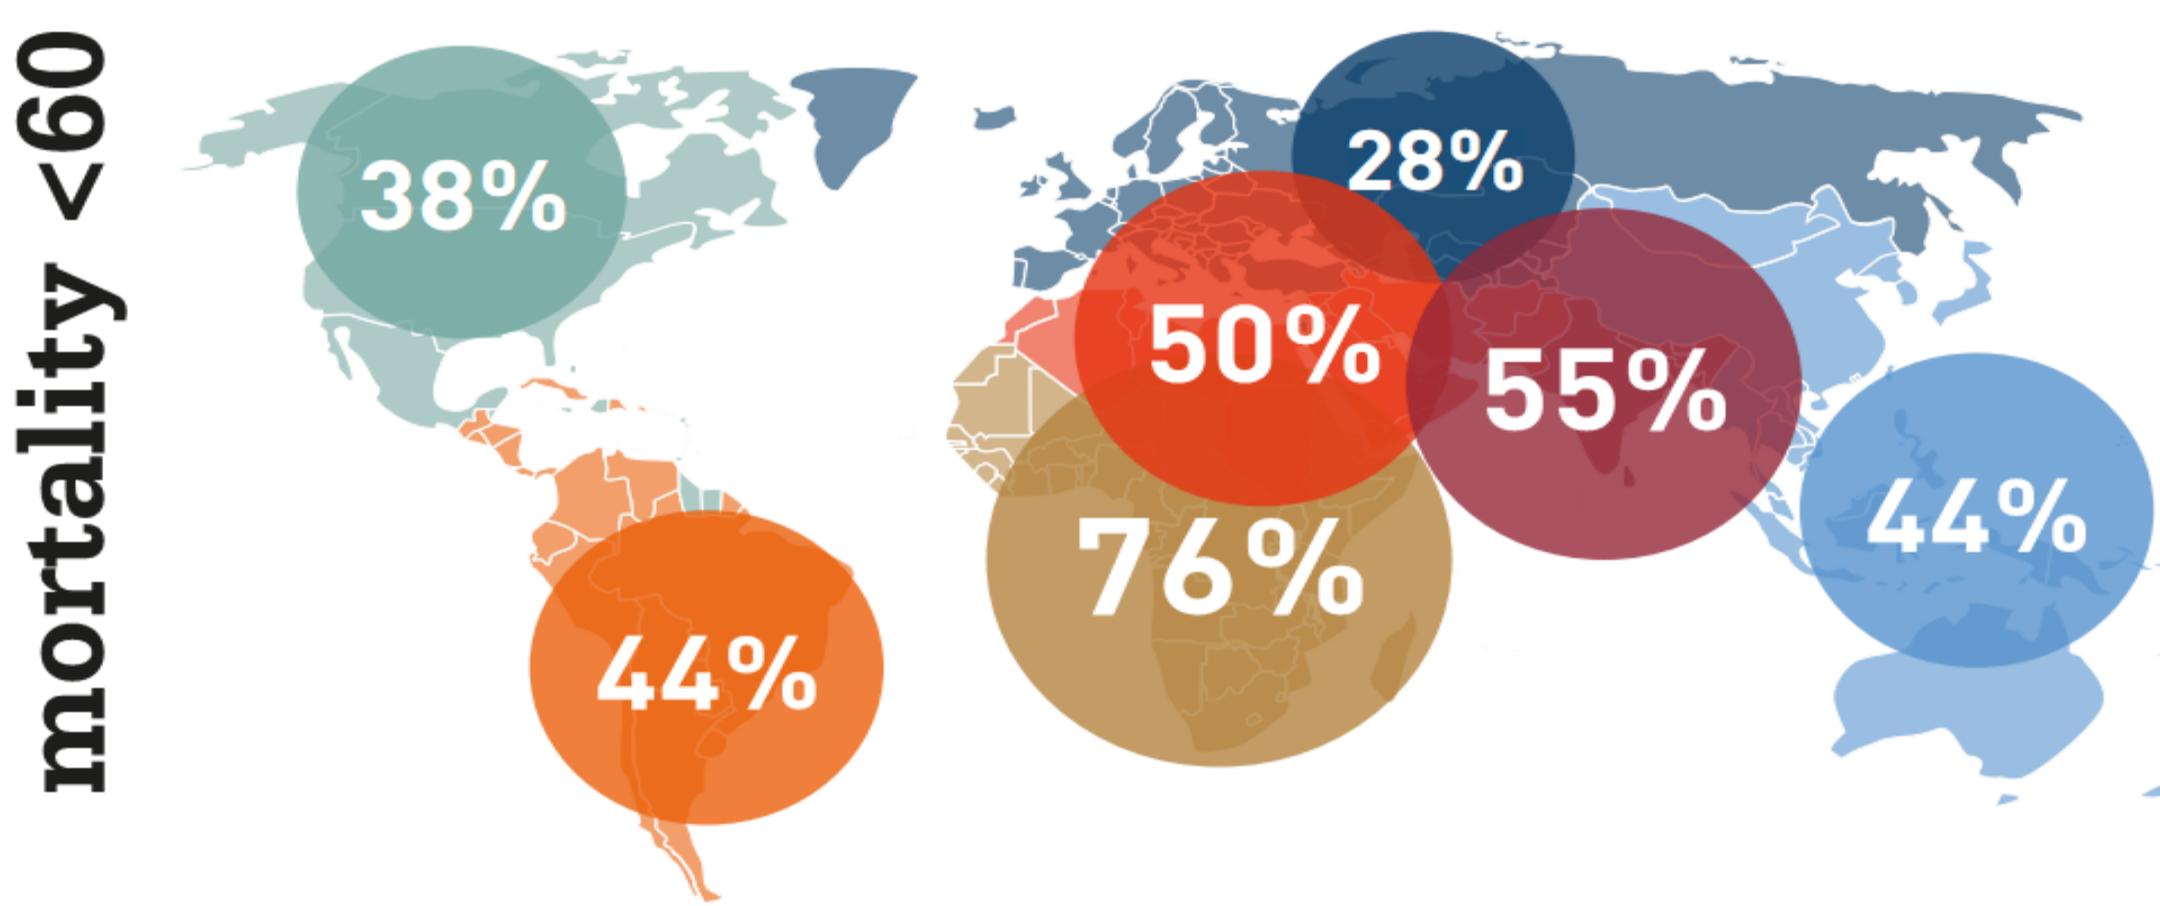
Leading cause of non-traumatic lower extremity amputations

National Diabetes Information Clearinghouse. Diabetes Statistics–Complications of Diabetes. (website) http://www.niddk.nih.gov/health/diabetes/pubs/dmstats/dmstats.htm#comp.

… and the costs to society are **high and escalating**

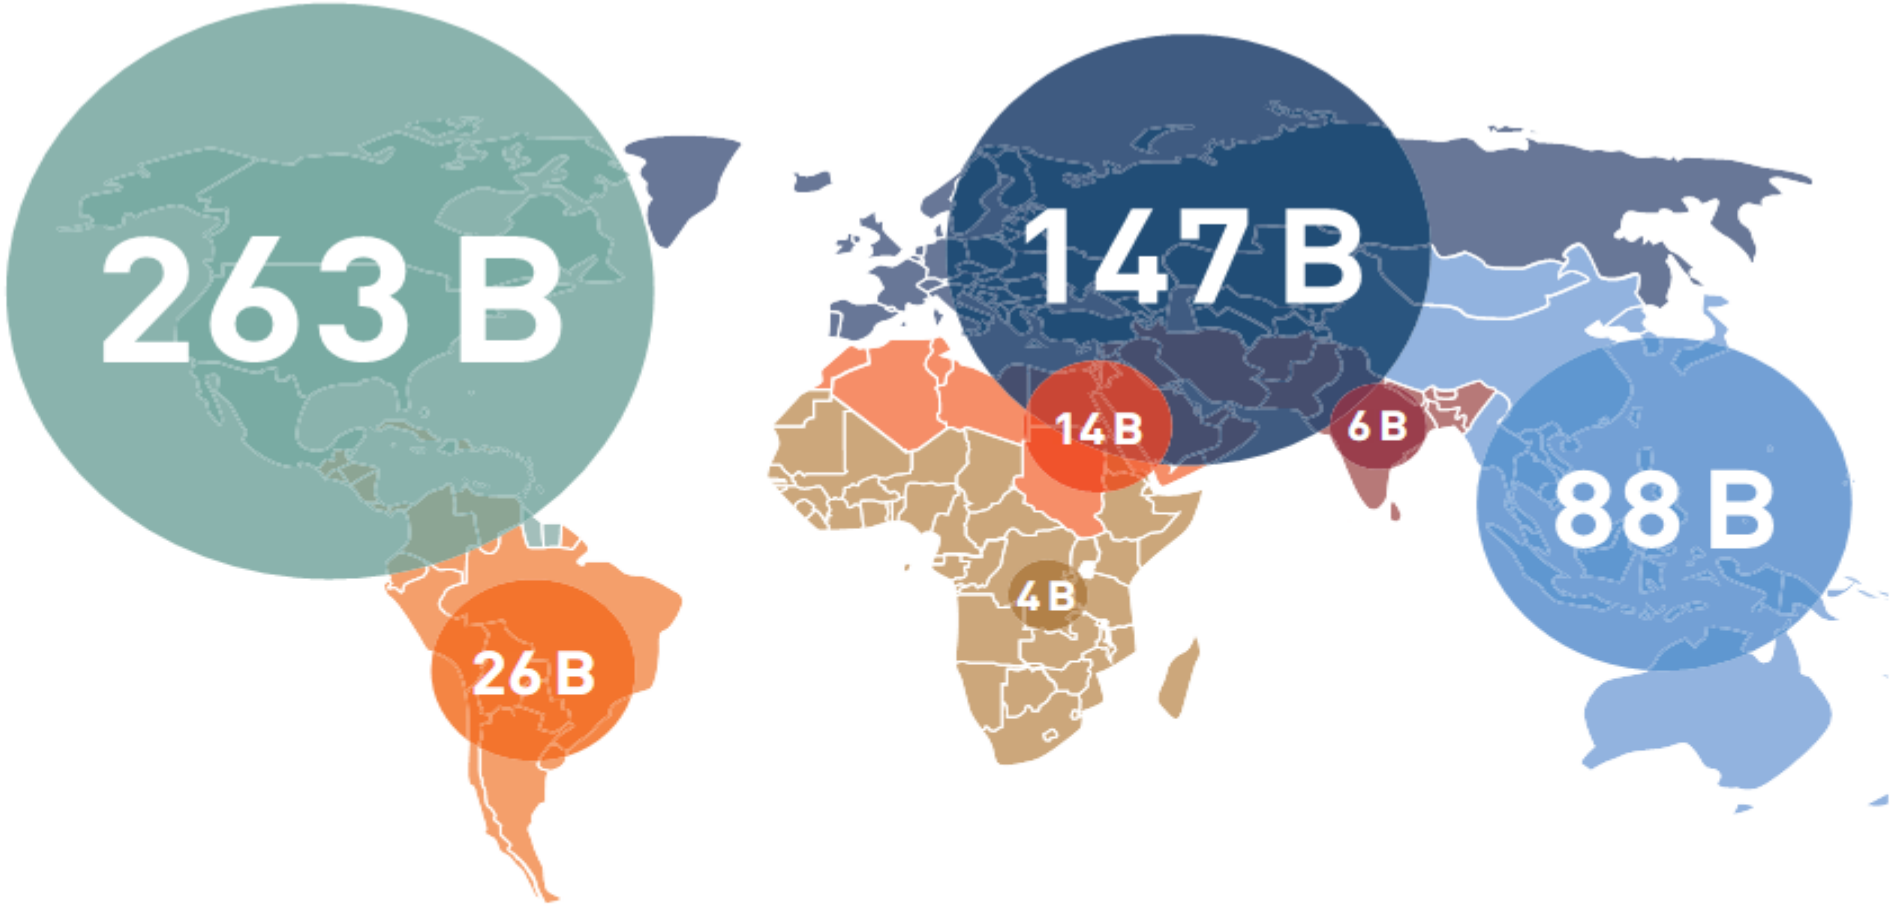
Diabetes kills one person every **six seconds**

5.1 million deaths due to diabetes **in 2013**



Of those who die from diabetes, what proportion do so before the age of 60?

expenditures



Health expenditure (USD) due to diabetes (20-79 years), 2013

Sight-threatening diabetic retinopathy at presentation to screening services in Fiji

- **27 %** of patients were graded as having sight threatening retinopathy at presentation
- In **15 %** this was bilateral
- Visual impairment and vision loss was observed in **9.4 %** of diabetic patients
- Comparison with patients entering screening in a UK setting – **6 %** had STR at presentation

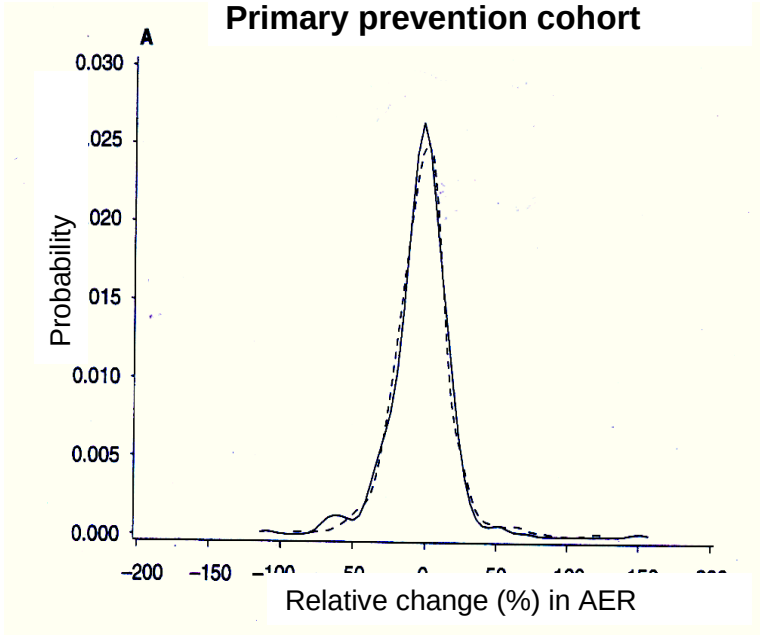
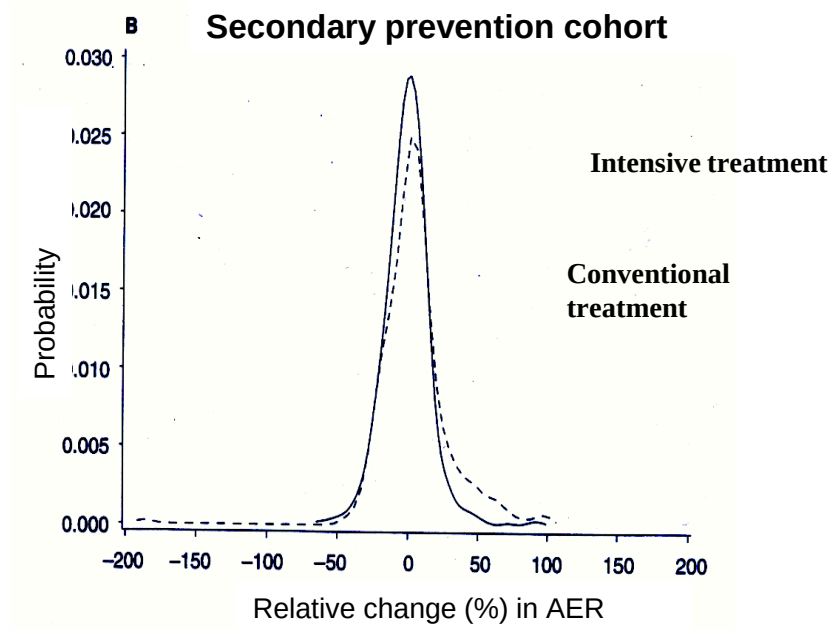
Diabetic retinopathy is preventable

Glycaemia increase	Associated risk increase		
1% increase in HbA_{1c}	21% increase in diabetes-related deaths P<0.0001	14% increase in myocardial infarction P<0.0001	37% increase in microvascular complications P<0.0001

Practice Points

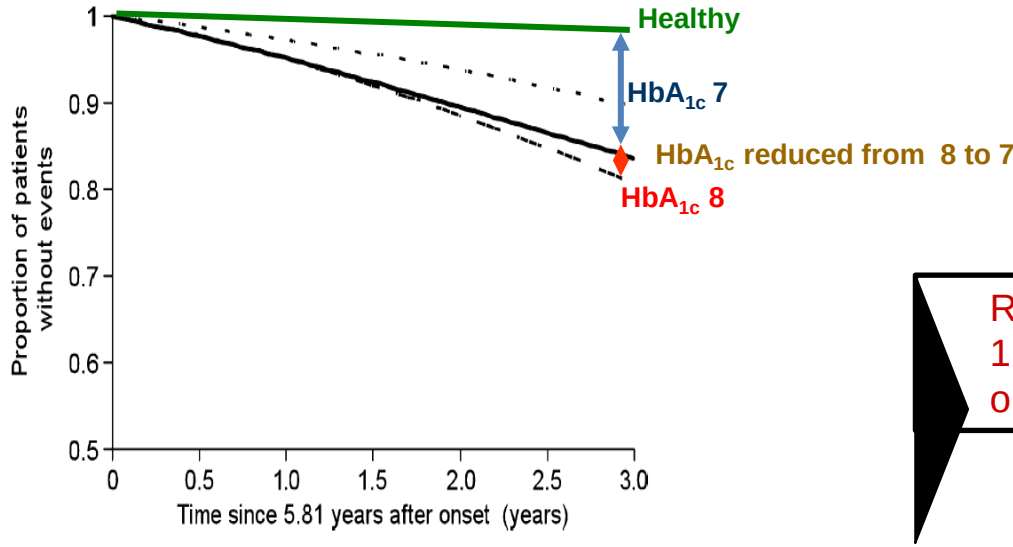
- In Denmark, only 20% of those with undiagnosed diabetes were identified by screening.
- For each person with diabetes identified, another two at high risk of diabetes and six at high risk of cardiovascular disease were identified.
- Screening for diabetes had limited short- and long-term adverse psychological impact on participants.
- Cardiovascular risk factors (weight, blood pressure and cholesterol), including health-related behaviors (smoking), improved substantially following detection of diabetes by screening.
- Small increases in treatment intensity of screen-detected patients were associated with a nonsignificant 17% reduction in risk of a first cardiovascular event.
- Among people with screen-detected diabetes, all-cause mortality over 7 years was twice as high for those with HbA1c <6.0% compared with those with HbA1c ≥6.5% at screening. Those with HbA1c <6.0% were less intensively treated than those with HbA1c ≥6.5%. The latter group had an all-cause mortality that was not significantly different from people with normal glucose tolerance and HbA1c <6.0% at screening, presumably due to more intensive treatment.
- At the population level, invitation of high-risk individuals to screening was not associated with a reduction in all-cause or diabetes-related mortality over 10 years.
- The ADDITION study provides further evidence of the net benefit associated with earlier detection and treatment of Type 2 diabetes. Rather than screening the population for diabetes, primary care teams should focus efforts on earlier detection and treatment of risk factors among those with diabetes, at high risk of diabetes and high risk of cardiovascular disease.





DCCT (*The DCCT Research Group, Kidney Int. 47:1703-1720, 1995)*

Distribution of slopes for urinary albumin excretion, expressed as relative percent change per year



M. Lind et al, Diabetologia 53:1093–1098, 2010

Recent clinical studies have shown that even in type 1 diabetes , HbA_{1c} and the duration of disease can only explain 11% of the late diabetic complications!

Targeting intensive glycaemic control versus targeting conventional glycaemic control for type 2 diabetes (Review)

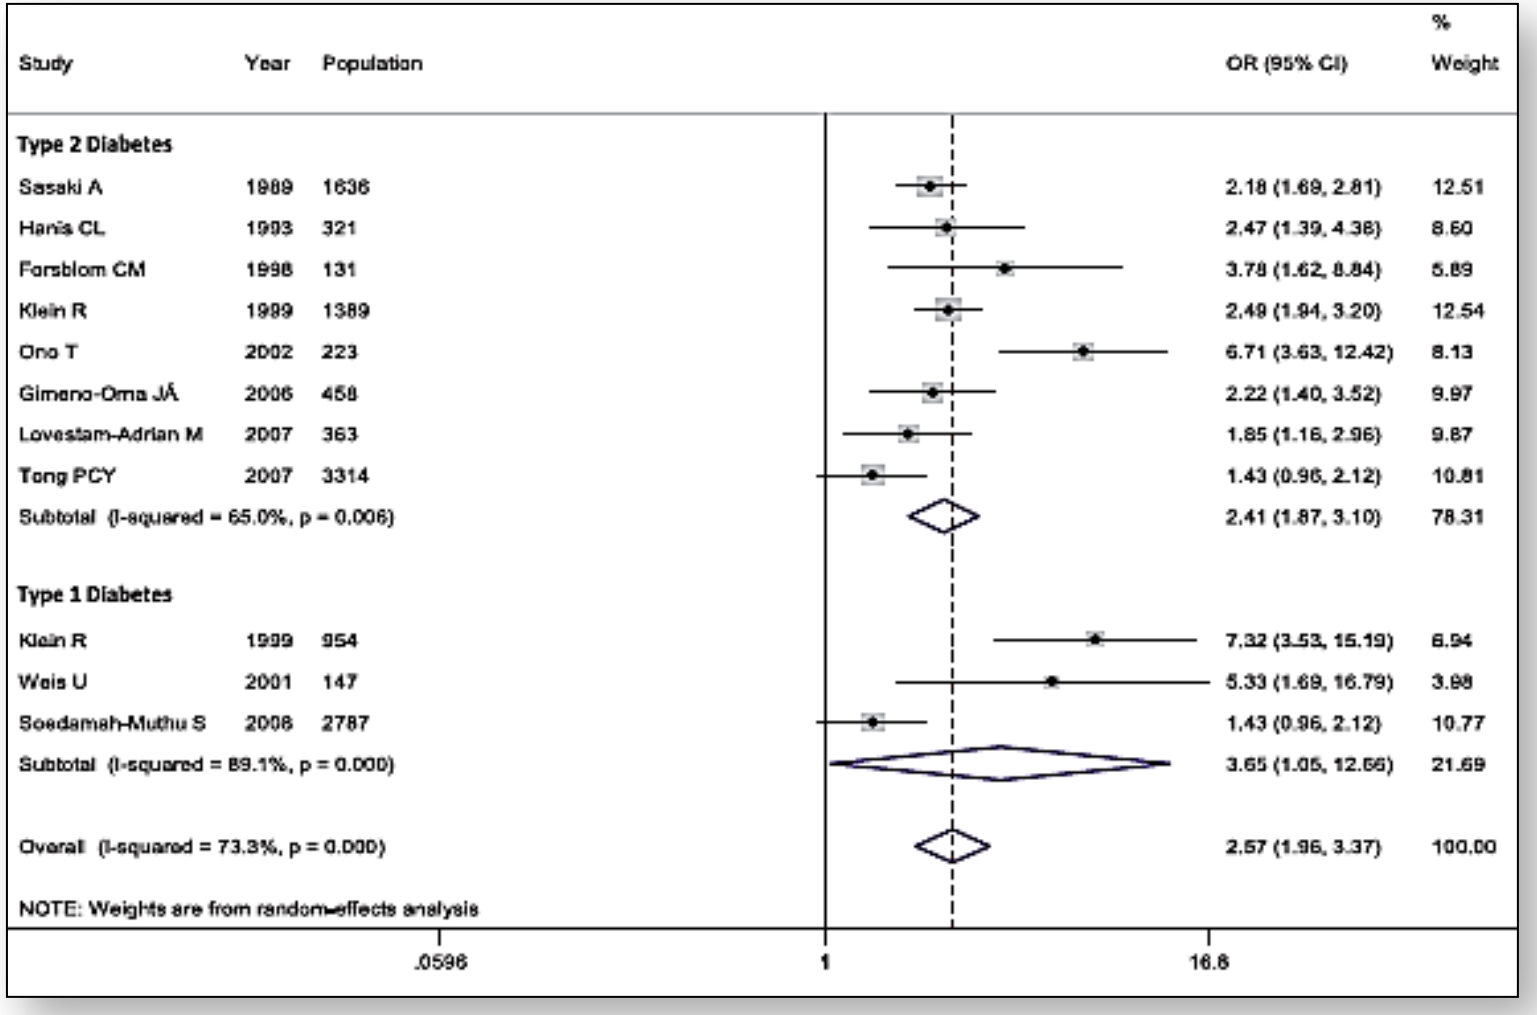
Predict CV-risk from retinal fundus imaging

Diabetic Retinopathy predicts all-cause mortality and cardiovascular events in both type 1 and type 2 diabetes



Kramer et al., Diab Care 2011

ESC Guidelines on diabetes, prediabetes, and cardiovascular diseases developed in collaboration with the EASD

Management of microvascular disease in diabetes		
Recommendations	**Class** [a]	**Level** [b]
Screening for the presence of retinopathy should be considered on annual basis in patients with T2DM.	IIa	B
Multifactorial therapy is recommended when retinopathy is progressing rapidly.	I	B
An HbA_{1c} <7% and a blood pressure <140/85 mmHg are recommended for primary prevention of retinopathy related to DM.	I	A
Lipid lowering should be considered to reduce the progression of retinopathy, the need for laser treatment, and the need for vitrectomy.	IIa	B
It is recommended that proliferative DM retinopathy is treated by pan retinal laser photocoagulation.	I	A
Grid laser photocoagulation should be considered in clinically significant macular oedema.	IIa	B
Intravitreal anti-vascular endothelial growth factor therapy should be considered in patients with vision impairment and clinically significant macular oedema involving the fovea.	IIa	B

Ryden, Grant et al., Eur H J 2013

Future perspectives for ‚medical retina‘

- Elucidate the „reno-retinal syndrome“
- Explain the diabetic „paradox“
- Predict CV-risk from retinal fundus imaging
- Predict visual outcome from novel markers
- Develop multimodal treatment targeting the neurovascular unit
